Modified differential equations

Ernst Hairer, Geneva

This is joint work with

Philippe Chartier and Gilles Vilmart

based on the monograph GNI written with

Christian Lubich and Gerhard Wanner
Program of the talk

Extending and combining the ideas of two well-established theories

- backward error analysis (modified equations),
- Hamilton–Jacobi theory (generating functions),

we derive new, efficient integrators

- preprocessed vector field integrators

for rigid body simulations.
1. Backward error analysis

**Given** a differential equation

$$\dot{y} = f(y), \quad y(0) = y_0$$

and a numerical one-step method

$$y_{n+1} = \Phi_h(y_n).$$

**Find** a modified differential equation

$$\dot{z} = f(z) + hf_2(z) + h^2 f_3(z) + h^3 f_4(z) + \ldots$$

such that for $t_n = nh$,

$$y_n = z(t_n)$$

Example 1: Lotka–Volterra and explicit Euler

\[ \dot{q} = q(p - 1), \quad q_{n+1} = q_n + h q_n(p_n - 1) \]

\[ \dot{p} = p(2 - q), \quad p_{n+1} = p_n + h p_n(2 - q_n) \]
Example 2: Lotka–Volterra and symplectic Euler

\[ \dot{q} = q(p - 1), \quad q_{n+1} = q_n + h q_n(p_{n+1} - 1) \]
\[ \dot{p} = p(2 - q), \quad p_{n+1} = p_n + h p_{n+1}(2 - q_n) \]
Summary of backward error analysis

\[ \dot{y} = f(y) \]
\[ \dot{z} = f_h(z) \]

numerical method

exact solution

\[ y_0, y_1, y_2, y_3, \ldots = z(0), z(h), z(2h), \ldots \]

modified differential equation

\[ \dot{z} = f_h(z) = f(z) + hf_2(z) + h^2f_3(z) + \ldots \]
2. Hamilton–Jacobi theory

“... Professor Hamilton hat ... das merkwürdige Resultat gefunden, dass ... sich die Integralgleichungen der Bewegung ... sämmtlich durch die partiellen Differentialquotienten einer einzigen Function darstellen lassen.” (C.G.J. Jacobi, 1837)

For a Hamiltonian system

\[ \dot{p} = -\nabla_q H(p, q), \quad \dot{q} = \nabla_p H(p, q) \]

the flow \((p, q) \mapsto (P, Q)\) is symplectic: \(P \, dQ - p \, dq = dS\), and can be expressed as

\[ P = \nabla_Q S(q, Q, t), \quad p = -\nabla_q S(q, Q, t) \]

where (Hamilton–Jacobi differential equation)

\[ \frac{\partial S(q, Q, t)}{\partial t} + H\left(\nabla_Q S(q, Q, t), Q\right) = 0 \]
We reformulate these formulas:

a) we consider \((P, q)\) as independent variables;

b) we let \(S^1(P, q, t) = P(Q - q) - S(q, Q, t)\)
We reformulate these formulas:

a) we consider \((P, q)\) as independent variables;

b) we let \(S^1(P, q, t) = P(Q - q) - S(q, Q, t)\)

The exact flow \((p, q) \mapsto (P, Q)\) of the Hamiltonian system

\[
\dot{p} = -\nabla_q H(p, q), \quad \dot{q} = \nabla_p H(p, q)
\]

is given by

\[
P = p - \nabla_q S^1(P, q, t), \quad Q = q + \nabla_P S^1(P, q, t)
\]

where \((\text{Hamilton–Jacobi differential equation})\)

\[
\frac{\partial S^1(P, q, t)}{\partial t} = H\left(P, q + \nabla_P S^1(P, q, t)\right)
\]

with \(S^1(P, q, 0) = 0\).
We reformulate these formulas:

a) we consider \((P, q)\) as independent variables;

b) we let \(S^1(P, q, t) = P(Q - q) - S(q, Q, t)\)

The exact flow \((p, q) \mapsto (P, Q)\) of the Hamiltonian system

\[
\begin{align*}
\dot{p} &= -\nabla_q H(p, q), \\
\dot{q} &= \nabla_p H(p, q)
\end{align*}
\]

is given by

\[
\begin{align*}
p_{n+1} &= p_n - \nabla_q S^1(p_{n+1}, q_n, h), \\
q_{n+1} &= q_n + \nabla_p S^1(p_{n+1}, q_n, h)
\end{align*}
\]

where (Hamilton–Jacobi differential equation)

\[
\frac{\partial S^1(P, q, t)}{\partial t} = H \left( P, q + \nabla_P S^1(P, q, t) \right)
\]

with \(S^1(P, q, 0) = 0\).
We reformulate these formulas:

a) we consider $(P, q)$ as independent variables;

b) we let $S^1(P, q, t) = P(Q - q) - S(q, Q, t)$

The exact flow $(p, q) \mapsto (P, Q)$ of the Hamiltonian system

$$\dot{p} = -\nabla_q H(p, q), \quad \dot{q} = \nabla_p H(p, q)$$

is given by

$$p_{n+1} = p_n - \nabla_q S^1(p_{n+1}, q_n, h), \quad q_{n+1} = q_n + \nabla_p S^1(p_{n+1}, q_n, h)$$

where (Hamilton–Jacobi differential equation)

$$\frac{\partial S^1(P, q, t)}{\partial t} = H\left(P, q + \nabla_P S^1(P, q, t)\right)$$

with $S^1(P, q, 0) = 0$. This can be formally solved:

$$S^1(P, q, h) = h H(P, q) + h^2 H_2(P, q) + h^3 H_3(P, q) + \ldots$$
Idea of generating function integrators

\[
\begin{align*}
\dot{y} &= J^{-1} \nabla H(y) \\
\dot{z} &= J^{-1} \nabla H_h(z)
\end{align*}
\]

\[
y(0), y(h), y(2h), \ldots = z_0, z_1, z_2, z_3, \ldots
\]

modified Hamiltonian

\[H_h(z) = H(z) + hH_2(z) + h^2H_3(z) + \ldots\]
Idea of generating function integrators

\[ \dot{y} = J^{-1} \nabla H(y) \]

exact solution

\[ \dot{z} = J^{-1} \nabla H_h(z) \]

numerical method

\[ y(0), y(h), y(2h), \ldots = z_0, z_1, z_2, z_3, \ldots \]

modified Hamiltonian

\[ H_h(z) = H(z) + hH_2(z) + h^2H_3(z) + \ldots \]

3. Preprocessed vector field integrators
3. Preprocessed vector field integrators

Recall from backward error analysis
3. Preprocessed vector field integrators

**Given** a differential equation

\[
\dot{y} = f(y), \quad y(0) = y_0
\]

and a numerical one-step method

\[
y_{n+1} = \Phi_h(y_n)
\]

**Find** a modified differential equation

\[
\dot{z} = f(z) + h f_2(z) + h^2 f_3(z) + h^3 f_4(z) + \ldots
\]

such that for \( t_n = nh \),

\[
y_n = z(t_n)
\]
3. Preprocessed vector field integrators

**Given** a differential equation

\[ \dot{y} = f(y), \quad y(0) = y_0 \]

and a numerical one-step method

\[ y_{n+1} = \Phi_h(y_n) \]

**Find** a modified differential equation

\[ \dot{z} = f(z) + hf_2(z) + h^2 f_3(z) + h^3 f_4(z) + \ldots \]

such that for \( t_n = nh \),

\[ z_n = y(t_n) \]
Idea of preprocessed vector field integrators

\[ \dot{y} = f(y) \]

exact solution

\[ y(0), y(h), y(2h), \ldots \]

numerical method

\[ \dot{z} = f_h(z) \]

modified differential equation

\[ f_h(z) = f(z) + h f_2(z) + h^2 f_3(z) + \ldots \]
Example: implicit midpoint rule

For the general differential equation $\dot{y} = f(y)$ we consider

$$y_{n+1} = y_n + h f\left(\frac{y_{n+1} + y_n}{2}\right)$$
Example: implicit midpoint rule

For the general differential equation \( \dot{y} = f(y) \) we consider

\[
y_{n+1} = y_n + h f\left(\frac{y_{n+1} + y_n}{2}\right)
\]

Modified differential equation for the preprocessed method:

\[
\dot{z} = f(z) + h^2 f_3(z) + h^4 f_5(z) + \ldots
\]

where

\[
f_3 = \frac{1}{12} \left( - f' f' f + \frac{1}{2} f''(f, f) \right)
\]

\[
f_5 = \frac{1}{120} \left( f' f' f' f' f - f''(f, f' f' f) + \frac{1}{2} f''(f' f, f' f) \right)
\]
Rigid body

\[ \dot{y} = \hat{y} I^{-1} y, \quad \dot{Q} = Q \hat{I}^{-1} y, \quad \hat{a} = \begin{pmatrix} 0 & -a_3 & a_2 \\ a_3 & 0 & -a_1 \\ -a_2 & a_1 & 0 \end{pmatrix} \]

where \( I = \text{diag} \ (I_1, I_2, I_3) \) are the moments of inertia.
Rigid body

\[ \dot{y} = \hat{y} I^{-1} y, \quad \dot{Q} = Q \hat{I}^{-1} y, \quad \hat{a} = \begin{pmatrix} 0 & -a_3 & a_2 \\ a_3 & 0 & -a_1 \\ -a_2 & a_1 & 0 \end{pmatrix} \]

where \( I = \text{diag} (I_1, I_2, I_3) \) are the moments of inertia.

We consider \( D = \text{diag} (d_1, d_2, d_3) \) where

\[ d_1 + d_2 = I_3, \quad d_2 + d_3 = I_1, \quad d_3 + d_1 = I_2, \]

Discrete Moser–Velselov (DMV) algorithm (Rattle):

For given \((y_n, Q_n)\), compute an orthogonal \( \Omega_n \) matrix from

\[ \Omega_n^T D - D \Omega_n = h \hat{y}_n. \]

The numerical solution after one step is then given by

\[ \hat{y}_{n+1} = \Omega_n \hat{y}_n \Omega_n^T, \quad Q_{n+1} = Q_n \Omega_n^T, \]
Preprocessed DMV algorithm

Apply the DMV algorithm with \( I_j \) replaced by \( \tilde{I}_j \) where

\[
\frac{1}{\tilde{I}_j} = \frac{1}{I_j} \left( 1 + h^2 s_3(y_n) + \ldots + h^{2r-2} s_{2r-1}(y_n) \right) \\
+ h^2 d_3(y_n) + \ldots + h^{2r-2} d_{2r-1}(y_n) .
\]

to get an integrator of order \( 2r \).

\[
s_3(y_n) = -\frac{1}{3} \left( \frac{1}{I_1} + \frac{1}{I_2} + \frac{1}{I_3} \right) H(y_n) + \frac{I_1 + I_2 + I_3}{6 I_1 I_2 I_3} C(y_n) ,
\]

\[
d_3(y_n) = \frac{I_1 + I_2 + I_3}{6 I_1 I_2 I_3} H(y_n) - \frac{1}{3 I_1 I_2 I_3} C(y_n) .
\]
